

BLEED BLOCK ASSEMBLY - 3/8"

Product Code: HPBBA38

BLEED BLOCK ASSEMBLY - 3/8"

This is an inline, High pressure bleed block complete assembly fitted with an encapsulated bleed screw for added safety!

This product is used to depressurise lines SAFELY, BEFORE you attempt to disconnect the line, or any products attached to it, to avoid dangerous situations whereby the operator can be injured from high pressure disconnection of the line.

One such product where to utilise this product is on your Air Lance (Spike / Wand) to allow you to safely disconnect it from the line without having to attach it to the car valve to release the internal pressure.

Australian Porsche Carrera Cup mandated to have the air lance (wand) and hose fitted without couplers to the supply pressure regulator, to avoid accidents and injury and this assembly will fit directly in line on Harris Regulators WE supply with our KIT versions, and also directly onto our Paoli Pitstop 3/8" female threaded hose assemblies.

Maximum pressure rating for this assembly is 4500 PSI (310BAR). We strongly recommend you consult recommended maximum pressures for any systems you may fit this assembly to, so you do not use more than the recommended pressures.

If you need one for your Paoli Pitstop regulator you may have, contact us we can help!
